# Milva

**medium early, high yielding quality  
ware potato**

- high marketable yield at all sites
- quality ware potato with pure yellow flesh colour
- no discolouration after boiling

Maturity	medium early	Tuber tuber shape eye depth flesh colour skin	oval shallow yellow yellow, smooth, seldom slightly netted
Cooking type (EAPR)	B		
Consumption quality	quality ware potato, clear yellow flesh colour, no discolouration after cooking		
Yield	very high marketable yield, very good suitable for packing, peeling and convenience products	Resistances PCN Potato Leafroll Virus late blight black leg common scab	Ro 1, Ro 4 medium - high high high high
Youth development	rapid	Sensitivities spraing bruising mechanical damage	low - medium low low - very low
Dormancy	high, good storability		

**Milva** has medium demands to the soil and water supply. Soils with very high pressure of spraing should be avoided.

**Milva** is growing very uniform medium to large sized tubers. Due to the medium tuberization rate the recommended plant density is approx. 43,000 plants/ha.

**Milva** has a very good nitrogen-efficiency, nitrogen fertilization therefore should be slightly reduced (approx. 10 - 15 %) in comparison to local standard.

**Milva** gives positive response to careful protective late blight control. Accurate control of aphids is recommended in order to ensure the brilliant tuber quality.

**Milva** reaches very high marketable yield under different environmental conditions. Due to the nice tuber shape the good table quality this variety is very good suitable for pre-packing.

All particulars are based on official variety trials and/or our own experience.  
However, as potatoes are natural products we cannot undertake any liability for these details.
